1-Who we are?

Engineering-Resources is an engineering HUP where we meet professionals with experience in the construction of large industrial projects.

Our experience covers from the economic and conceptual analysis phase of the design, to its commissioning and delivery.

Our fields of expertise are Nuclear, Oil&Gas and Offshore Wind

If you are looking for a team to develop your project, here you can find a partner.

Gints Filipsons

MSc Mechanical Engineer,
IWE European Welding Engineer

Over 20 years of experience in oil & gas transportation systems, energy construction, O&M of power plants, conformity assessment, welding.

Lately, I have been involved in offshore wind projects in the Baltic Sea and now, I am coordinating the area, to introduce companies interested in the renewable energy sector and developing business.

Primitivo Carranza

PhD Physical Engineering
MSc Industrial Engineer,

MBA, CEng, IPMA level 2.

Corporate Governance for Directors
certificate

Allow me to introduce myself as a professional with over 20 years of experience in the construction of large-scale industrial projects. Throughout my career, I have worked in various industries, including nuclear energy and the oil & gas sector. All this activity was in different countries in North America, Europe, and Middle East.

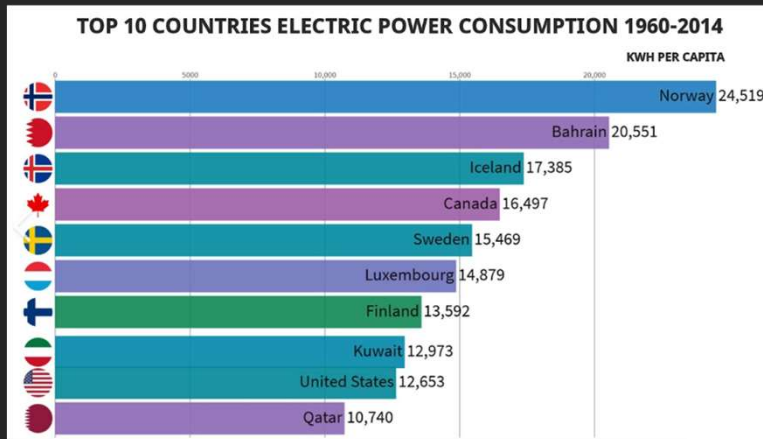

In the past 5 years, I have dedicated my expertise and knowledge to offshore wind projects in the Baltic Sea working from Germany.

I have utilized my knowledge and experience to actively participate in various technical committees, where I can share and learn from other professionals to enhance the industry. Currently, I am a member of the International Expert Committee at DNV offshore wind projects.

I also collaborate as a Visiting Professor for the International Master in Renewable Energy in the Marine Environment (REM+)

3-Renewable energy outlook

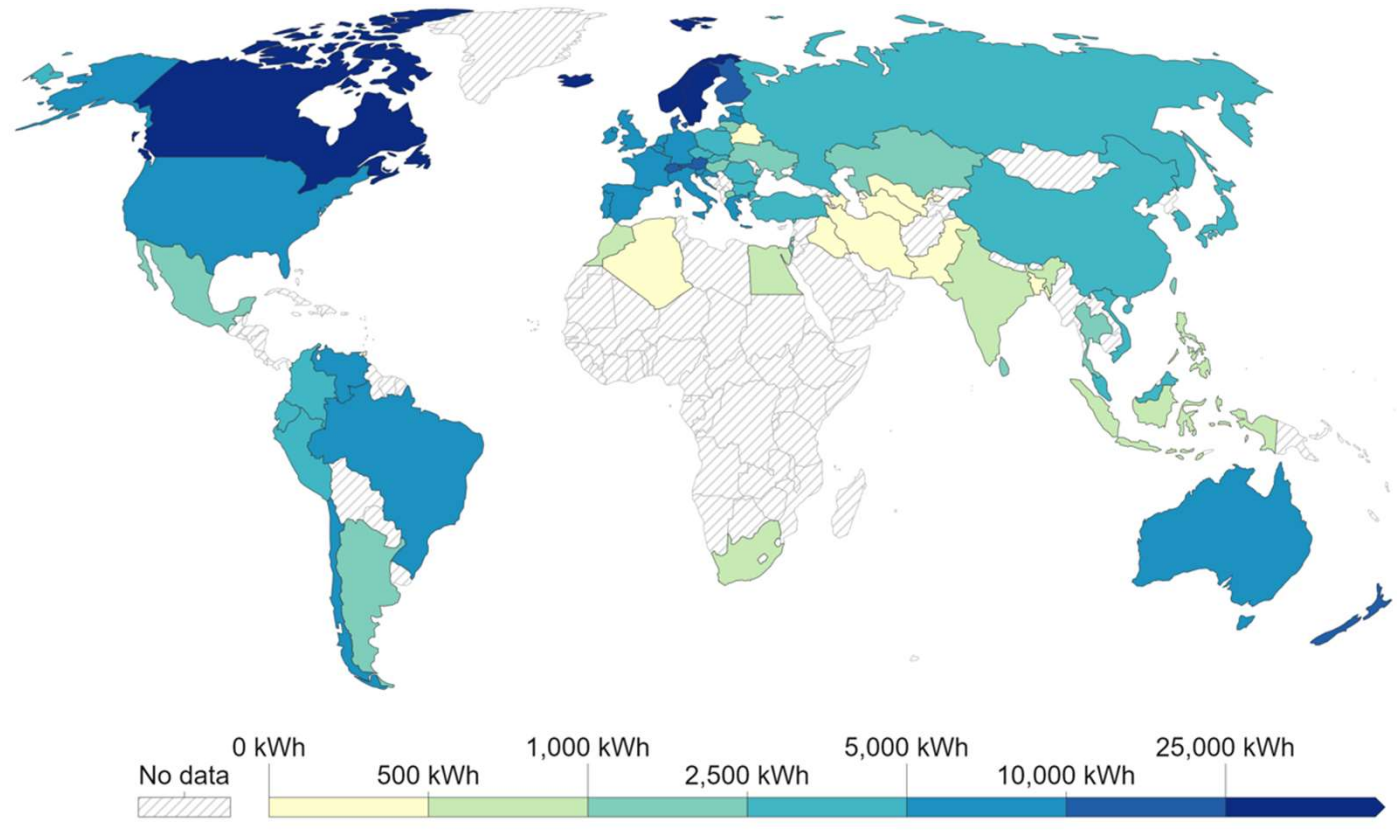

Renewable electricity output (% of total electricity output)

1990 - 2019

|||

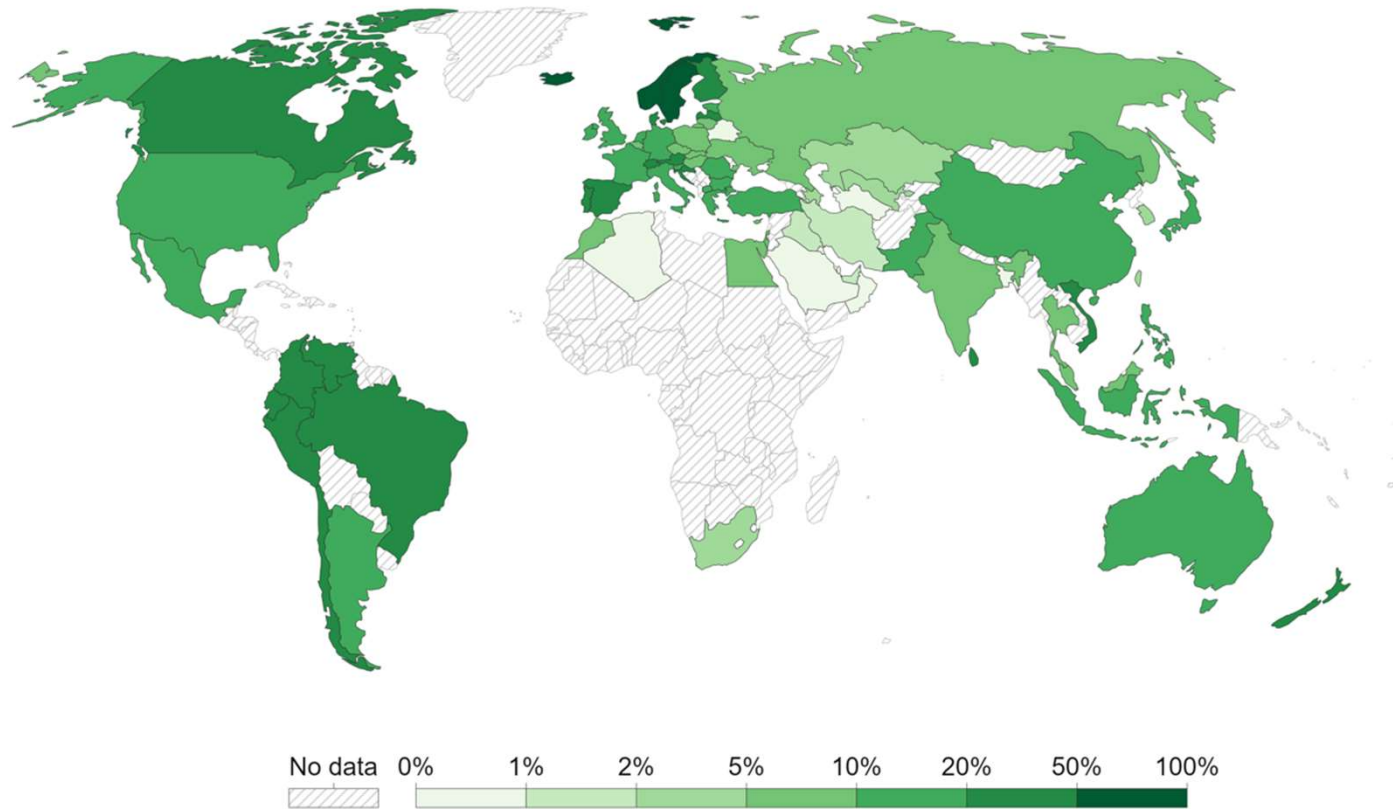

|||

Per capita energy consumption from renewables, 2021

Renewables is the sum of energy from hydropower, wind, solar, geothermal, wave and tidal, and bioenergy. Traditional biofuels are not included.

Note: 'Primary energy' refers to energy in its raw form, before conversion into electricity, heat or transport fuels. It is here measured in terms of 'input equivalents' via the substitution method: the amount of primary energy that would be required from fossil fuels to generate the same amount of electricity from renewables.

Share of primary energy from renewable sources, 2021

Renewable energy sources include hydropower, solar, wind, geothermal, bioenergy, wave, and tidal. They don't include traditional biofuels, which can be a key energy source, especially in lower-income settings.

5-Latest cost trends

- Photovoltaic: GHI = 950-1300 kWh/(m²a), LR = 15%, average market development
- Wind Onshore: FLH of 1800 to 3200 h/a, LR = 5%, average market development
- Wind Offshore: FLH of 3200 to 4500 h/a, LR = 7%, average market development
- Bioenergy: FLH of 4000 to 7000 h/a
- PV small scale rooftop systems (< 30 kW_p) incl. battery storage 1 kW_p : 1 kWh
- PV large scale rooftop systems (30 - 1000 kW_p) incl. battery storage 2 kW_p : 1 kWh
- PV utility-scale (> 1 MW_p) incl. battery storage 3 kW_p : 2 kWh
- CCGT: FLH, fuel costs, efficiencies, CO₂ prices depending on year of operation, see table 4-6
- Gas Turbine: FLH, fuel costs, efficiencies, CO₂ prices depending on year of operation, see table 4-6

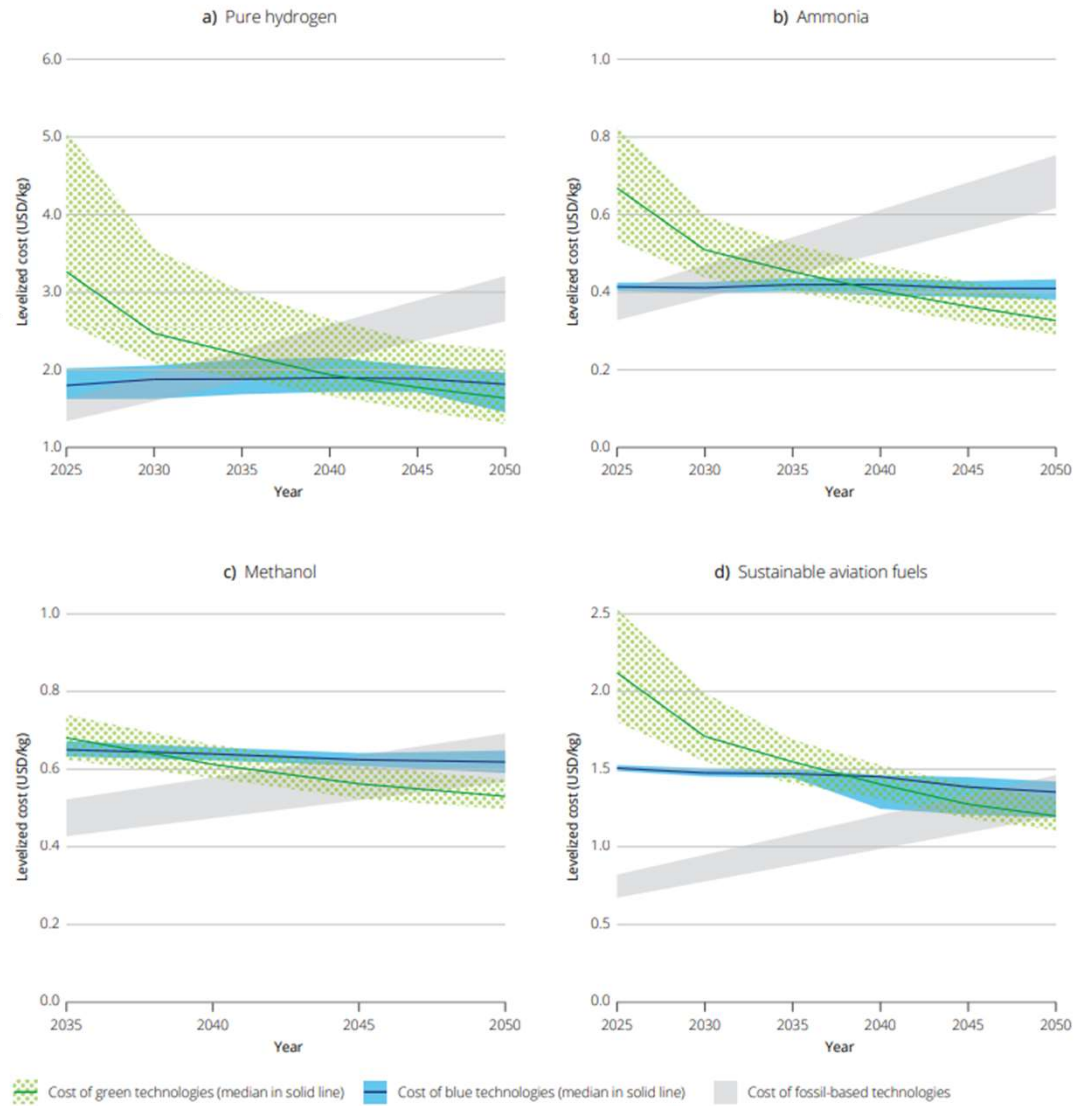

Cost Reduction Pathway From 2018 to 2030 for Fixed-Bottom Offshore Wind

The GPRA baseline value starts at \$89/MWh (in 2018 USD) set in FY 2019 using 2018 reference project data reported in Stehly and Beiter (2019).

The GPRA target is \$51/MWh by 2030 (in 2018 USD) and is derived for a fixed-bottom wind plant with 15 MW at the reference site based on cost reductions informed by technology innovations considered in the spatial economic analysis by Beiter et al. (2016).

Outlook on production costs of clean hydrogen and its derivatives, 2025 to 2050

6-General overview of wind parks

6.1 - Cost

6.2 –Cost Drivers

6.3 - Typical Capex

6.4 - Typical Opex (25 years)

6.1 Cost

Levelled costs reflect the average cost of energy per unit of electricity output over the lifetime of an electricity plant and are useful for evaluating technology progress.

© Berkeley Lab

6.2 Cost Driver

A key driver in these improvements is turbine size, according to experts. For onshore wind, growth is expected not only in generator ratings (to 5.5 megawatts [MW] on average in 2035) but also in two other factors that increase capacity – rotor diameters and hub heights. Offshore wind turbines are expected to get even bigger, to 17 MW on average in 2035. Floating offshore wind is anticipated to gain market share, growing from its current pre-commercial state and accounting for up to 25% of new offshore wind projects by 2035.

6.3 Typical Capex

- ❑ Capex for Onshore wind farm
- ❑ Capex for offshore wind farm
 - ❑ Fixed-bottom Offshore
 - ❑ Floating Offshore Wind

onshore

CAPEX for typical onshore wind farm, 2020

Typical 200 MW onshore wind plant in the interior US, comprising 73 wind turbines at 2.8 MW each, operating for 25 years with no major O&M events

offshore

CAPEX for typical offshore wind farm, 2020

a typical 600 MW fixed-bottom offshore wind project comprising 75 wind turbines at 8.0 MW each, operating for 25 years with no major O&M events

Parameter	Value (\$/kW)
Turbine	1,301
BOS	1,866
Development and project management	91
Substructure and foundation	496

Short-Term Actions To Build a Strong Foundation (2023–2024)

To build a **strong supply chain foundation** for the offshore wind energy industry, the country needs to:

- Convene working groups focused on regional and holistic supply chain development
- **Identify locations** to build the **next wave of supply chain** development equitably and efficiently
- Continue to expand the offshore wind energy pipeline
- Assess the need for and impact of **incentive** mechanisms beyond existing programs
- Establish strategies and incentive mechanisms targeted at **floating wind** infrastructure
- Establish curriculum and funding streams for **workforce training centers**
- Conduct outreach and education activities with existing suppliers to increase awareness of offshore wind energy opportunities.

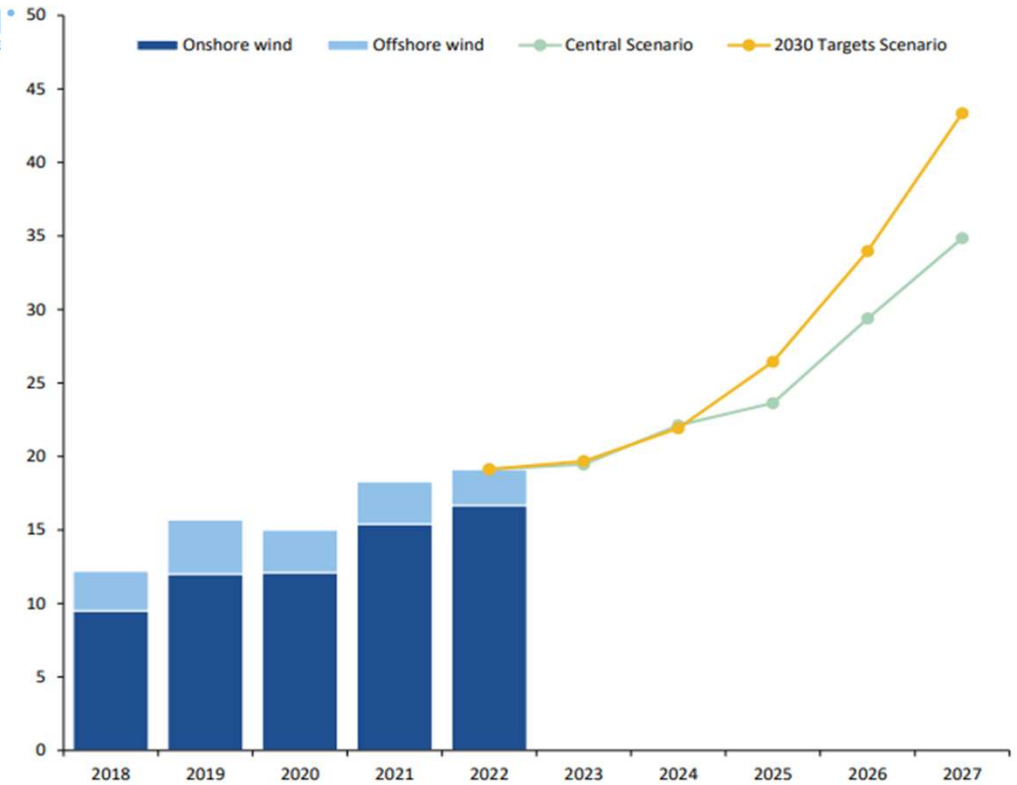

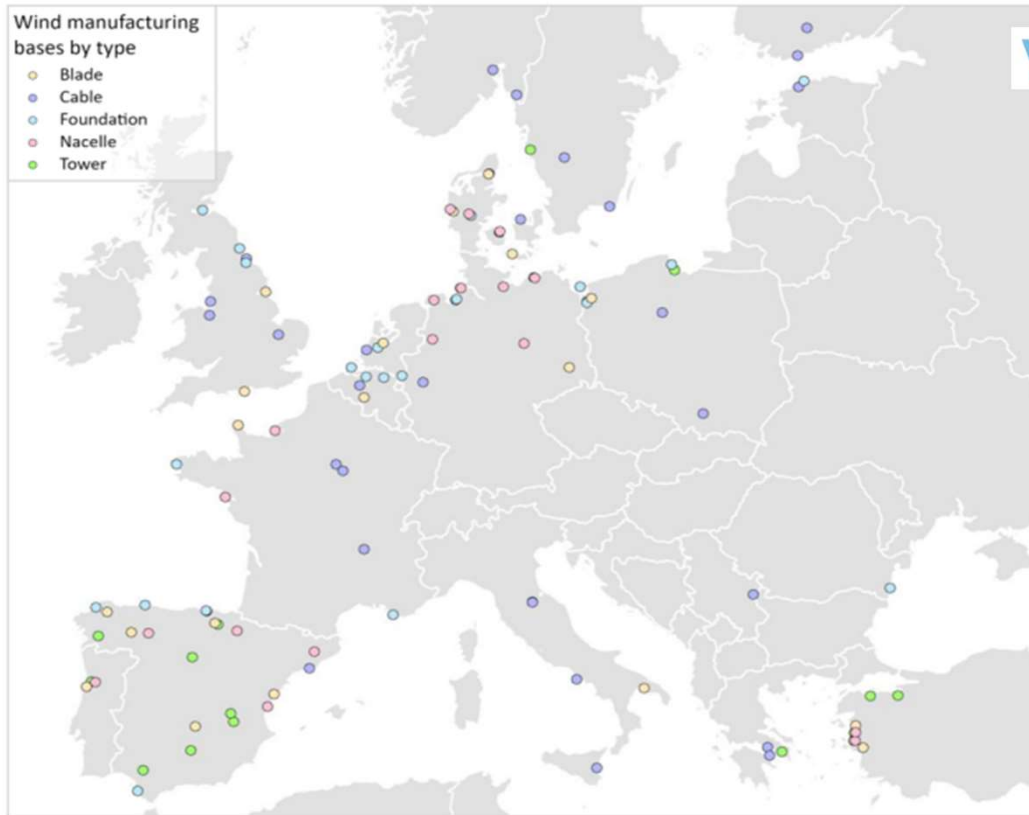

Medium-Term Actions To Gain Momentum (2025–2029)

To gain momentum with a smoothly running domestic supply chain for the offshore wind energy industry, the country needs to:

- Construct the major supply chain facilities needed to meet the demand pipeline
- Continue to expand the offshore wind energy pipeline
- Leverage national, regional, and industry **working groups to share and develop best practices** for supply chain activities
- Incorporate **learning from early-stage commercial-scale projects** into ongoing operations and decision-making
- Train a sufficient **manufacturing workforce**
- Evaluate procedural and impact equity metrics for early-stage commercial-scale projects and incorporate best practices into ongoing supply chain development activities

Country resource planning (Supply chain)

Segment	Industry	Sub-segment	2022-2030 demand growth*	Time to action*	Urgency assessment	Comment
Turbines	Onshore & Offshore wind	Total market	~3X Capacity (MW)	2024-2025		<ul style="list-style-type: none"> High inflation, low margins and an R&D race to supply the largest turbines on the market has put pressure on western OEM's ability to expand manufacturing capacities or repurpose facilities to accommodate a changing demand. While onshore wind turbine size demand is relatively more stable, expansion of manufacturing is needed to match growth in activity levels in the 2030 Targets Scenario.
	Offshore wind	>12 MW turbines	0-29 GW	2024		<ul style="list-style-type: none"> Offshore wind serves as the key challenge, with a large gap between current manufacturing capacity and projected demand for the largest models. Rotor blade manufacturing represents the current bottleneck for European turbine supply, but both need a rapid expansion to meet demand in this scenario.
Towers	Onshore & Offshore wind	All	~2.5X Metric tons	2025		<ul style="list-style-type: none"> Centralized tower supply for a larger range of turbines has enabled the supply chain to expand with growing activity. Tower demand will be driven by a relatively high number of onshore wind turbines (compared to offshore wind) and increasing offshore wind activity and sizes. Growth is expected to accelerate in the second half of the decade, creating an additional need for expansion.
Foundations	Offshore wind	Monopiles	~12X Metric tons	2024-2025		<ul style="list-style-type: none"> Monopiles will remain the most popular concept in Europe, and with rapid growth in activity and turbine sizes in offshore wind, manufacturing must be scaled up quickly within the largest monopile segments. Jacket manufacturing capacity less constrained thanks to O&G industry. Floating foundation manufacturing must be industrialized. Today, it is characterized by pilots, demos and pre-commercial projects with one-off manufacturing and few units. From this small basis, manufacturing capacity must grow substantially towards the end of the decade.
		Other grounded	~7X Metric tons	None		
		Floating	~23X Metric tons	2024		
WTIVs	Offshore wind	Total market	~7.5X Vessel years	2024-2025		<ul style="list-style-type: none"> Strong fleet additions in recent years have put supply in a strong position to cover demand in the next two to three years. Increased demand in the second half of the decade, primarily in the largest turbine size ranges will put pressure on supply. A global fleet and increasing demand outside Europe will likely pull supply out of Europe, worsening the supply-demand balance, with new units forecast to be needed. An increasing share of demand in the 15-20 MW range towards 2030 will also drive a need for new units, as the fleet of vessels capable of installing these units is currently limited.
